The specifications

- Using the data from the **fakePeopleAPI.js** create a basic crud app, **using functional React Components (React HOOKS)**

- Allow the user to see the list of people and their details in a table format.

- Let the user create new people by clicking a button above the top right of the table.

- In the rightmost column of the table have a "Details" button that a user can click to view and edit the details. Use a modal for the creation, editing, and viewing of the person.

- For creating, open a modal with all the fields in the people object. (people object is described in the API comments).

    o   Make all these fields required except for friends.

    o   Allow the user to select friends from the existing list of people.

- For view/edit, open a modal by default in the "view mode" where all the fields are not editable.

    o   If the user presses the edit button, change all the fields to editable and show 3 new buttons, "Save", "Cancel", and "Delete".

    o   Again, make sure that all the fields except for friends are mandatory for saving.

Our evaluation

- We will be evaluating code quality and UI design. Refer to the mock-up below to build the UI. The mock-up is intentionally not complete. It's just to give an idea of the structure we are looking for.

- Feel free to add any styles or components that will make this app look better and feel nicer to use.

- Use your best judgement for anything that may be missing or incomplete.

The deliverables

- The JS and CSS files needed for us to be able to run the application.

- Ideally, we would like a demo link to your work hosted on a platform like CodePen or similar, but this is not a requirement.

Mock-up

People

Name	Age	Friends	... other fields
Ada Lovelace	34	• Grace Hopper • Joan Clarke	Details
Grace Hopper	28		Details
Margaret Hamilton	33		Details
Joan Clarke	40		Details

Click to open modal

Person   Edit

Name   Ada Lovelace

Age   34

... Other fields

Friends

Name	Age	....
Grace Hopper	28	
Joan Clarke	40	

Add/remove friends
